# Population & Economic Development **LINKAGES** 2007 Data Sheet

**A**round the world, substantial resources have been devoted to family planning and reproductive health programs that have helped improve the health of women and families. But little is known about how these investments affected their economic well-being—raising income levels and bringing people out of poverty. Decades of research have produced no clear consensus on how demographic change affects economic development or vice versa. But the two tend to be interrelated.

This data sheet explores the associations between demographic change and economic development. Its purpose is to stimulate discussion and promote further inquiry and research. The data presented here are not intended to imply cause and effect between any of the indicators. In most cases, the indicators we present influence each other both directly and through other factors.

# Association Between Average Annual Population Growth Rates and GDP per Capita Growth Rates, 1975-2004

Globally, a higher rate of population growth is associated with a lower rate of economic growth, but the association varies across regions and income levels.

## Use of Modern Contraception by Wealth

Across the world, poor women use contraceptives at lower rates than wealthier women. However, strong family planning efforts can increase use of contraceptives in all wealth groups, even in low-income countries such as Bangladesh.

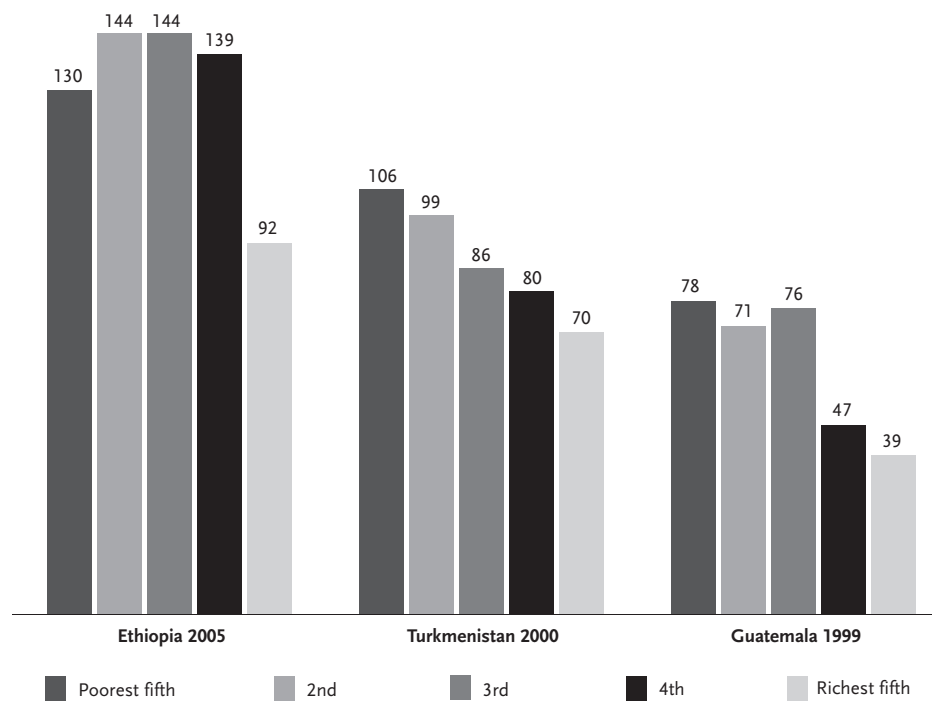

Percent of married women using modern contraception

## Child Mortality by Wealth

The mortality of children under age 5 varies between the wealthy and the poor in a country. People in lower wealth groups face more risk of their children dying than those in wealthier groups.

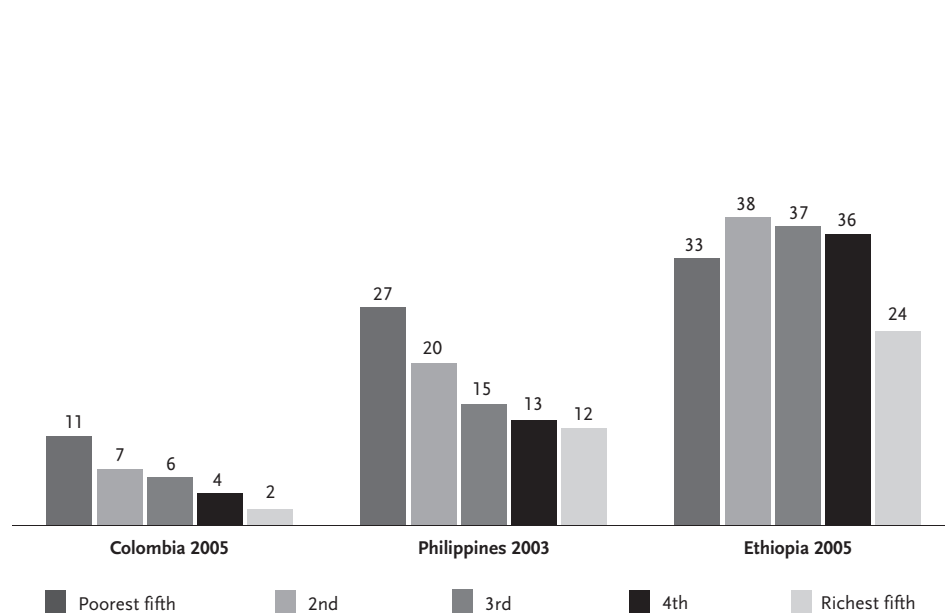

Deaths of children under age 5 per 1,000 live births

## Unmet Need for Family Planning by Wealth

The poorest often have the highest unmet need for family planning services. However, in some countries, such as Ethiopia, the poorest may have low unmet need because they desire large families. In countries with strong family planning programs, such as Colombia, unmet need for family planning is relatively low, especially when compared to neighboring countries.

Percent of women with unmet need for family planning

## Period of Potential Demographic Bonus

Countries with increasing numbers of working-age adults relative to dependent elderly and children have an opportunity to increase employment, investment, and savings. This additional economic advantage in growth and well-being is called a demographic bonus, as shown below for selected countries.

## Association Between Fertility and Education

Girls' secondary school enrollment tends to be higher in countries with lower fertility rates.

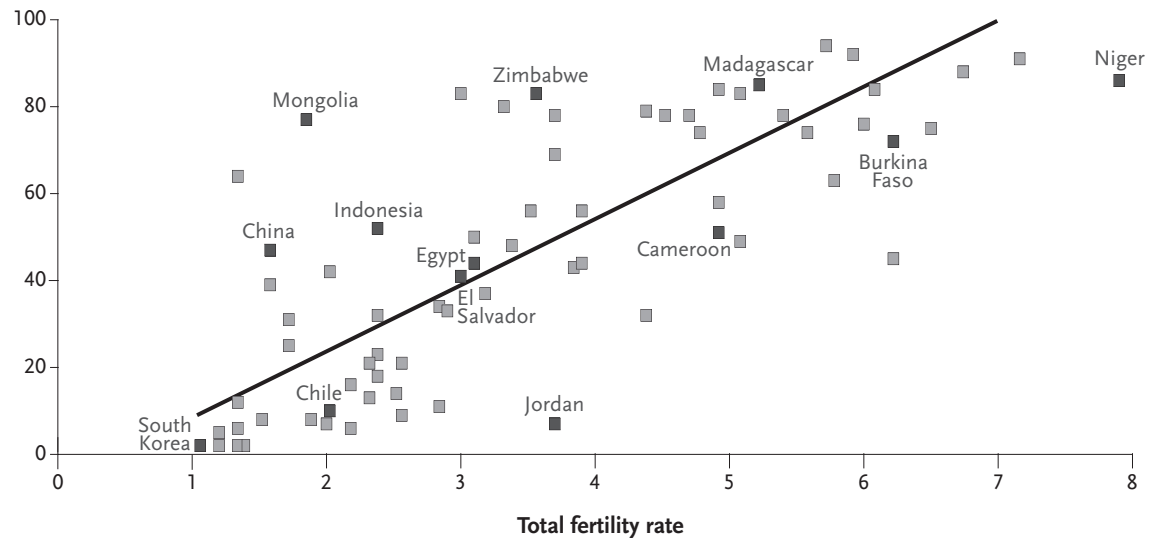

Percent of girls enrolled in secondary school

## Association Between Fertility and Poverty

Countries with a higher percentage of people living in poverty often have higher fertility rates.

Percent of population living on <\$2 per day

# NOTES, SOURCES, DEFINITIONS, AND ACKNOWLEDGMENTS

## NOTES

Data on inequality were drawn from Demographic and Health or Reproductive Health surveys between 1997 and 2005. The surveys asked about household health, nutrition, and fertility, as well as assets, such as type of flooring and/or roof; source of water; availability of electricity; possession of such items as watches, radios, bicycles, or a car; and other characteristics related to wealth.

The household assets were combined into a single wealth index and the population was divided into quintiles, or five wealth groups of equal size, based on the individuals' relative standing on the household index. The wealth index provides a country-specific, relative definition of economic status rather than an absolute definition of wealth. The economic status of the lowest or poorest quintile in Haiti, for example, is different from that of the poorest quintile in Brazil. Thus, data comparisons among countries must be made with caution.

The use of an asset measure rather than income or consumption measure is necessary when income and consumption data are unavailable or unreliable.

Poorest, middle, and richest fifths are the first, third, and fifth quintiles.

The fitted lines in the scatterplot graphs represent overall trends in reported data.

Inequality data for Cape Verde, Georgia, Ecuador, El Salvador, Honduras, Paraguay, Romania, and Albania refer to socioeconomic status in terciles and are not directly comparable to quintile data.

Data for Serbia/Montenegro refer to the former Serbia and Montenegro and where possible, the independent countries.

The regional graph for Europe includes some countries where data were available for the period of 1985–2004 only.

Data prior to 1997 are shown in *italics*.

<sup>a</sup> Trend data shown for GDP per capita for the earlier period (1975–1984) corresponds to 1985–1994.

<sup>b</sup> Average number of children born to a woman during her lifetime.

<sup>c</sup> Deaths to children under age 5 per 1,000 live births.

\* Countries where the period of potential demographic bonus is projected to extend beyond 2050.

— Indicates data unavailable or not applicable.

I and II (2003); **Child Mortality by Wealth:** ORC Macro, Demographic and Health Surveys; **Unmet Need for Contraceptives by Wealth:** ORC Macro, Demographic and Health Surveys; **Association Between Fertility and Education:** United Nations Population Division, *World Population Prospects, The 2004 Revision*; and UNESCO Institute for Statistics Database, Enrolment Ratios by ISCED Level (<http://stats.uis.unesco.org>, accessed Nov. 2006); **Association Between Fertility and Poverty:** United Nations Population Division, *World Population Prospects, The 2004 Revision*; and World Bank, *World Development Indicators 2006*; and **Period of Potential Demographic Bonus:** United Nations Population Division, *World Population Prospects, The 2004 Revision*; and World Bank, *World Development Report 2007*.

In addition to sources listed above, the data sheet is based on: Population Reference Bureau, *World Population Data Sheet 2006*; U.S. Centers for Disease Control and Prevention Reproductive Health Surveys; and UNICEF Multi-Indicator Cluster Surveys.

## DEFINITIONS

**Child Mortality Rate:** Deaths to children under age 5 per 1,000 live births. The figure is based on births in the 10 years preceding the survey.

**GDP per Capita, PPP:** GDP per capita based on purchasing power parity (PPP). Data are in constant 2000 international dollars.

**Gross Domestic Product PPP:** Gross domestic product (GDP) converted to international dollars using purchasing power parity (PPP) rates. An international dollar has the same purchasing power over GDP as the U.S. dollar has in the United States. GDP is the sum of gross value added by all resident producers in the economy plus any product taxes and minus any subsidies not included in the value of the products. It is calculated without making deductions for depreciation of fabricated assets or for depletion and degradation of natural resources. Data are in constant 2000 international dollars.

**Number of Working-Age Adults per Dependent Child:** Number of working-age adults (ages 15 to 64) per dependent child (ages 14 or younger).

**Percent of Females Enrolled in Secondary School:** The ratio of the number of females enrolled in secondary school to the female population in the applicable age group (such as ages 12 to 17) for the country. This number can exceed 100 when the number of students currently enrolled exceeds the population of the relevant age group.

**Percent of Married Women Using Modern Contraception:** The percentage of married or “in-union” women ages 15 to 49 who are currently using a modern method of contraception. These methods include the pill, injectables, implants, IUD, condom, and sterilization.

**Period of Potential Demographic Bonus:** Years of a country's projected continuous decline in the total dependency ratio (allowing for pauses of no more than five years). Total dependency ratio is the ratio of the number of dependents (ages <15 and 65+) over the number of working-age adults (ages 15 to 64). Where multiple periods of decline have occurred in a country, the last period of decline between 1950 and 2050 is shown.

**Population Growth Rate:** The number of persons added to (or subtracted from) a population in a year due to births, deaths, and net migration expressed as a percentage.

**Population Living on <\$2/Day:** The proportion of people living on less than \$2 per day is the percentage of the population with average consumption expenditures less than \$2.15 per day measured in 1993 prices converted using purchasing power parity (PPP) rates. The World Bank's estimates are drawn from surveys that use common methods for measuring household living standards across countries. When estimating poverty worldwide, it is appropriate to use the same reference poverty line, which is expressed in a common unit across countries. The World Bank uses reference lines set at \$1 per day (extreme poverty) and \$2 per day (poverty) in 1993 PPP terms, where PPPs measure the relative purchasing power of currencies across countries. For analysis of poverty trends in a particular country, use of the national poverty line is often preferable. Most data refer to the late 1990s and early 2000s.

**Total Fertility Rate:** The average number of children a woman would have assuming that current age-specific birth rates remain constant throughout her childbearing years (usually considered to be ages 15 to 49).

**Unmet Need for Family Planning:** Women have an unmet need for family planning if they are married women of reproductive age (ages 15 to 49) who say they do not want more children or want to wait two or more years to have another child, yet are not using contraception.

## ACKNOWLEDGMENTS

**Authors:** Donna Clifton, Toshiko Kaneda, Rachel Nugent, and Erin Sines. **Special thanks** go to Lori Ashford, Bill Butz, Thomas Goliber, Carl Haub, Mai Hijazi, Tom Merrick, Nina Pruy, Joan Robertson, Richard Skolnik, Rhonda Smith, and Joanne Wei for their insight and assistance. **Design and Production:** Michelle Corbett
